

Project No. 4
COIL STORAGE BUILDING

CLIENT: Mitsui Canada Inc. **LOCATION: Cambridge, Ontario**

The client, MITSUI, required a 128,000 sq. ft. coil storage facility to be built in two phases on a Greenfield site. TCE was to provide complete turnkey services, including site location and transportation studies, financing, facility planning and designing, facility construction, and hiring of personnel for the office and plant operations.

TCE used our American Building Company pre-engineered steel building system to construct the building, which includes administration offices and plant facility. In addition to the warehousing area for storing steel coils, the plant has a new \$5 million inspection and slitting line for testing coils for defects prior to shipping to the end user. The building also has two 35-ton and two 30-ton overhead cranes.

TCE provided all construction and installation services for the line and operating equipment, as well as for network communications used within the facility. The building and all associated work were completed on schedule and within budget.
