

**Project No. 8**  
**TUBE MILL EQUIPMENT**  
**FOUNDATIONS**

**CLIENT: Dofasco Inc.**      **LOCATION: Hamilton, Ontario**

The client required new foundations for tube mill line equipment. The project included the demolition of existing equipment foundations.

The new production line foundations required complex concrete forming systems. The work incorporated over 5,000 embedded anchor bolts. The project also involved the construction of numerous pits, trenches and equipment bases. TCE exceeded all construction tolerances for the placement of anchor bolts. As a result, equipment could be placed accurately and without any delay.

The project was schedule-driven to meet fixed production dates, and TCE successfully constructed the foundations within this tight timeframe. The success of this project was due in large measure to a close cooperative relationship between TCE, the client and the consultants.
